Display Asian or Russian characters in viflow (KB10168)

Sebastian Eich - 2018-08-06 - 0 Comments - in Modellierung / Modeling

Problem:

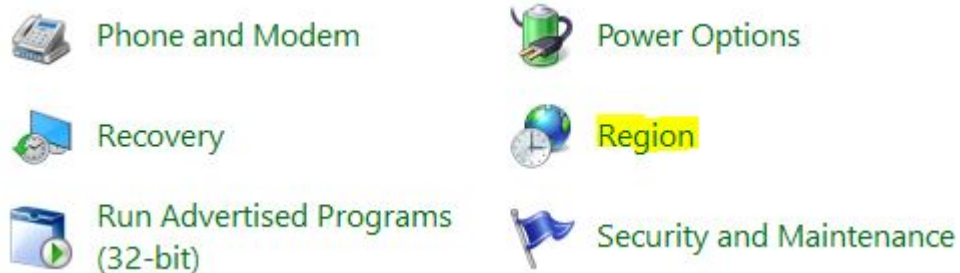

viflow is unable to display asian or russian character. They are only displayed in the Microsoft Visio process graphic.

Solution:

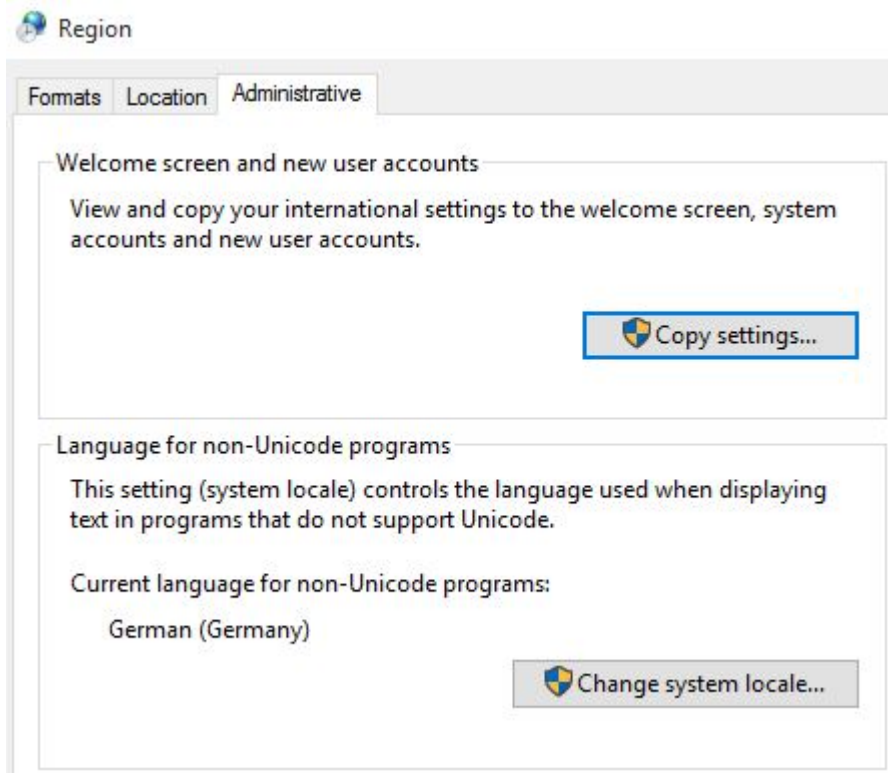

viflow is a non-Unicode program. To activate the support for wide character font, the language for non-Unicode programs in Windows must be changed.

How-to:

1. Open the Windows Control Panel and select "Region"

3. In the Region settings is a Tab called "Administrative". There you can change the language for non-Unicode programs.

4. Start viflow

Special cases:

If its not possible to see all characters correctly in viflow (you can see between the correct characters a ? instead of the correct character) then the [Microsoft Visual Basic 6.0 Common Controls](#) have to be installed. Always install the English version, regardless of the system language.

After installing and restarting the system, all characters will now be displayed correctly.

On **non-Chinese systems**, a key must be added to the Windows registry to prevent a **viflow 6** security feature from deleting single Chinese characters. This function is automatically deactivated on purely Chinese systems.

You have to deactivate it manually on your system.

This is done under HKEY_CURRENT_USER/Software/VB and VBA Program Settings/Vicon/ViFlow/060/ViFlow.

Create a new string called DisableXMLCorrection and set the value to 1.
